

What is Data Migration?

Data migration is the process of transferring data between different types of file formats, databases, or storage systems. It's often more than just simply moving data from one system or database to another. Data migration can involve more complicated processes like data mapping and re-formatting.

Industry experts expect the **Data Migration** market to reach nearly **\$11.5 billion in 2022** and up to **\$22.8 billion by 2026**.
